Ref²Avi

by ITAVI

In **Significant Impact Groups:**

AMU reduction strategies \ Monitoring and surveillance Antibiotic

Species targeted: Poultry;

Age: Different for different species;

Summary:

The RefA²vi network is a french national network whose objective is to produce regular references on antibiotic exposure indicators calculated on the basis of a common method and measured for each poultry species, in particular turkeys and broilers.

This approach is complementary to the ALEA published each year by Anses-ANMV. The methods used to calculate the RefA²vi indicators are based on the ALEA method and can be adapted for each species.
