

120 Tools & Checklists

Milk & Dairy Beef Drug Residue Prevention Reference Manual (USA)

by National Milk Producers Federation

In **Significant Impact Groups:**

Prudent use AB \ Farmer

Species targeted: Dairy;

Age:

Summary:

This manual contains all you need to know about administering, recording and storing drugs on farms in the US. It includes an 8-step plan for keeping useful medicine records, comprehensive drug residue testing protocols and lists of licensed drugs (for in the USA) with withdrawal periods. Additionally, there are top tips that producers can take to lessen the chances of antibiotic residues as well as checklists for when treating animals e.g. read the product label and consult your veterinarian before administering, use a clean injection site and a sterile needle for all injections, discard milk from all four quarters even when treating only one quarter with an IM tube, make certain that any procedure used to divert milk from treated cows cannot accidentally send contaminated milk into the pipeline, train employees on proper injection technique and do not go back into the vaccine bottle with a needle once it has been used for anything else.
